

# eNAM vs. Sarvah

*What eNAM is, where it falls short, and what Sarvah is tackling.*

## 1. What is eNAM?

**eNAM (National Agriculture Market)** is a Government of India portal that connects APMC mandis into a single online trading platform. It is run by SFAC under the Ministry of Agriculture.

**Scale:** 1,522+ mandis connected across India, 13+ languages (including Marathi), live auction, online payments, mobile app, and toll-free helpline (1800 270 0224).

## 2. eNAM's Features

eNAM is feature-rich. Key capabilities visible on [enam.gov.in](http://enam.gov.in):

| Category             | Features                                                                                                                                         |
|----------------------|--------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Mandi Network</b> | 1,522+ integrated mandis; state-level unified licenses so one trader license works across all mandis in a state.                                 |
| <b>Trading</b>       | Live trade dashboard, real-time trading data, e-NAM MIS analytics, and historical trade data.                                                    |
| <b>Pricing</b>       | Live price information, Agmarknet integration, eNAM vs Agmarknet price comparison, and ReMS price dissemination.                                 |
| <b>Quality</b>       | Physical Quality Control (QC) labs at mandis with standardized commodity parameters.                                                             |
| <b>Logistics</b>     | eNAM-Logistics module for transport providers, Kisan Rath for vehicle arrangement, and eNWR (warehouse receipts).                                |
| <b>Demand/Supply</b> | Advance Supply and Advance Demand modules for pre-positioning produce and demand signals.                                                        |
| <b>Platform</b>      | Mobile app, Platform of Platforms (PoP) for third-party integrations, and dedicated portals for farmers, traders, FPOs, APMCs, and mandi boards. |
| <b>Documentation</b> | Operational Guidelines PDF, training calendar, eLearning videos on YouTube, and trader FAQs.                                                     |

## 3. eNAM's Flaws (for smallholder farmers)

eNAM is built for traders, APMCs, and large FPOs. For the individual smallholder, it has clear gaps:

| Flaw                        | Why it matters for smallholders                                                                                           |
|-----------------------------|---------------------------------------------------------------------------------------------------------------------------|
| <b>APMC bureaucracy</b>     | Requires mandi registration, unified licenses, and mandi-board integration. Slow onboarding; remote farmers get left out. |
| <b>Complex UI</b>           | Government-style navigation, heavy PDFs, multiple logins. A farmer with a basic phone will struggle.                      |
| <b>No decision-support</b>  | Shows price data but does not say SELL NOW or WAIT. Farmers still interpret data themselves.                              |
| <b>No individual buyers</b> | Built for bulk traders, not retail or individual buyers. No way to sell 1-10 tons to one person.                          |

| Flaw                                  | Why it matters for smallholders                                                                             |
|---------------------------------------|-------------------------------------------------------------------------------------------------------------|
| <b>Mandi-level QC only</b>            | Quality is tested at the mandi, not on each lot. Remote buyers cannot see lot-level grade before purchase.  |
| <b>No trust layer for individuals</b> | Trust comes from the APMC system. For direct farmer-to-individual deals, there is no verified-buyer signal. |
| <b>No localized trend</b>             | Aggregate national/state data, not a personal 30-day chart for your crop in your district.                  |
| <b>Mandi-dependent</b>                | Only works inside the mandi system. Farmers outside mandi network cannot use it.                            |
| <b>Translation, not Marathi-first</b> | Marathi is one of 13 languages, but the design is not Marathi-native.                                       |

## 4. What Sarvah Tackles

**Sarvah** is a 4-day hackathon prototype for Maharashtra's smallholders. It does not replace eNAM; it fills the gaps eNAM leaves open for individual farmers.

| eNAM Gap                              | Sarvah's Tackle                                                                                           |
|---------------------------------------|-----------------------------------------------------------------------------------------------------------|
| <b>No decision-support</b>            | SELL/WAIT recommendation engine (percentile + 7-day trend + seasonality) with reasoning chips.            |
| <b>Complex UI</b>                     | Clean mobile-first Next.js UI. Pre-baked demo URLs (?crop=soybean&district=latur) for instant judge view. |
| <b>No individual buyers</b>           | Two-sided flow: farmer posts lot → any individual or trader buyer makes an offer → farmer accepts.        |
| <b>Mandi-level QC only</b>            | Per-lot A/B/C grade + quality notes on every lot detail page. (Self-declared, mocked, acknowledged.)      |
| <b>No trust layer for individuals</b> | Verified buyer badge component (mocked criteria, visible badge).                                          |
| <b>No localized trend</b>             | 30-day Recharts trend chart, multi-mandi overlay, for farmer's specific crop + district.                  |
| <b>Mandi-dependent</b>                | Works for direct farmer-to-buyer flow outside mandis. Farmer can also still sell at mandis.               |
| <b>Translation, not Marathi-first</b> | Marathi-first toggle on every key screen, not a translated afterthought.                                  |
| <b>No transport awareness</b>         | Basic distance heuristic: farmer's district → buyer sees ~km estimate with warning if > 50 km.            |

## 5. What Sarvah Still Has to Tackle

Honest status of the 18 spec items in the problem statement:

| Status                         | Items                                                                                                                                                                                                   |
|--------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Built (8)</b>               | Mandi price aggregation, buyer demand, quality requirements, localized trends, sale-window recommendation, match farmers/buyers, lot creation, digital offers, transaction records.                     |
| <b>Mocked / Partial (5)</b>    | Arrival volumes (one stat widget), verified buyer credentials (badge), quality grading (A/B/C self-declare), distance consideration (heuristic), payment tracking (transaction record only, no escrow). |
| <b>Deferred to roadmap (5)</b> | Logistics coordination, storage options, transport options, dispute resolution, real KYC.                                                                                                               |

**Tally:** 8/18 functional (~44%), 18/18 acknowledged (100%). Target: 70% functional, 100% acknowledged.

### One-line summary

**eNAM** is the national mandi-trading infrastructure. **Sarvah** is the lightweight, Marathi-first, decision-support layer for the smallholder farmers eNAM under-serves.
